Online Food Delivery System is a software that allows users to place orders and have their favorite food items delivered to them. It gives users an easy to use, interactive application that automates the manual process of calling the restaurant and ordering food.

We are utilizing PHP and MySQL to build this software, PHP will be used to build the interactive front end while MySQL will be used to build the backend database.

The aim of this project is to make an error-free, computerized process in an easy to use, interactive application with multiple features like address saving, multiple payment methods etc. for ordering food and having it delivered to the user.
